J. C. WAHL.
TOGGLE JOINT SELF FILLING PEN.

UNITED STATES PATENT OFFICE.

JOHN C. WAHL, OF CHICAGO, ILLINOIS, ASSIGNOR TO THE WAHL COMPANY, OF WILMINGTON, DELAWARE, A CORPORATION OF DELAWARE.

TOGGLE-JOINT SELF-FILLING PEN.

1,365,754.

Specification of Letters Patent.

Patented Jan. 18, 1921.

Application filed January 5, 1918. Serial No. 210,515.

To all whom it may concern:
Be it known that I, John C. Wahl, a citizen of the United States, residing at Chicago, in the county of Cook and State of 5 Illinois, have invented certain new and useful Improvements in Toggle-Joint Self-Filling Pens, of which the following is a specification.

My invention is a self filling fountain pen 10 in which the ink is contained in a deflatable sack, and a lever is provided for deflating the sack for the purpose of refilling the pen

with ink

The object of my invention is to improve 15 certain structural details of pens of this type and to provide a structure which shall be susceptible of cheap and accurate manufacture and which may be readily assembled in the position in which it is to be used.

My invention will be best understood by reference to the following figures, of

Figure 1 is a longitudinal section of the

Fig. 2 is a longitudinal section with the lever in its operative position;

Fig. 3 is a section along the line 3-3 of

Fig. 4 is a disassembled view of some de-

30 tails;

Fig. 5 is a detail view, and

Fig. 6 is a view of the blank from which

the pen lever is made.

Referring to the figures, 10 is an outside 35 casing preferably made of hard rubber, which serves as a support for a plug 11, in which is mounted the pen nib 12, and which is provided at its rear end with a nipple 13, on which is placed a rubber sack 14, serving 40 as a container for the ink. The nib 12 is provided with the customary feeding nib 15, which is of course provided with suitable channels for the supplying of ink to the nib 12. Since the particular means of keeping 45 the pen 12 supplied with ink do not form a part of my present invention, I will omit the description. Ink feeds are well known in the art and any suitable construction may be used in connection with my herein de-50 scribed invention.

In pens of the type herein described, it is necessary to provide means for deflating the ink sack when it is desired to refill the same, the customary procedure being to de-

flate the sack, then inserting the pen nib 12 55 into a supply of ink and allowing the sack to expand, thus refilling itself with ink by suction. For the purpose of readily deflating the ink sack 14, I have provided the presser bar 16, which extends practically the 60 entire length of said sack and have supported said presser bar by a flat link 17, which is pivoted on a bar 18 in the presser bar and is also pivoted in a slot 19 in the end of a spring 20. The spring 20 is the 65 rear end of a support 21, which is made of spring steel and serves as a support for the lever and presser bar action, as will hereinafter be described. The support 21 has a shell 22, which is formed into a circular 70 shape, approximately the diameter of the interior of the casing 10, and said shell 22 is provided with a small projection 23, which registers with a hole 24 in the interior of the casing 10, thus serving to hold the support 75 21 firmly in its proper position. The shell 22 is normally somewhat larger than the interior of the casing 10, but since the shell 22 is provided with a slot 25, the circular section of the support may be sprung into its place 80 in the interior of the casing.

Opposite the projection 23 is a pivot bar 26, which is formed in the shell 22, as shown in Fig. 4. The pivot bar 26 serves as a support for the lever 27, by means of which the 85

presser bar 16 is operated.

The lever 27 is formed from a piece of flat stock of approximately the outline as shown in Fig. 6 and when formed into shape provides a pivot hole 28, which engages the 90 pivot bar 26 and an operating shoulder 29, which engages the surface 30 of a lug 31, which is riveted in the presser bar 16. The which is riveted in the presser bar 16. lever 27 is also provided with a pair of ears 32 and 33, which register with slots 34 95 and 35 in the presser bar 16. When the lever is in the position shown in Fig. 2, contact with the presser bar 16 is made by a pair of lugs 36 and 37, which are also formed on the lever 27. The pivot holes 28 100 are provided with slots 38, for the purpose of allowing disengagement of the lever 27 from the pivot bar 26.

It is to be noted that when the lever 27 is in its normal position, as shown in Fig. 1, 105 that the tension of the spring 20 is transmitted through the link 17 to the presser bar 16, and by means of the lug 31 riveted

therein to the surface 29 of the lever 27. Since when the lever is in its closed position the surface 29 is above the pivot bar 26, the tension of the spring 20 will thus serve to 5 hold the lever 27 firmly in its closed position, the action being a species of toggle joint. The lever 27 is provided on its under side with shoulders 39, which, when the lever 27 is in its open position (Fig. 2) contact with 10 the interior of the shell 22 and thus determine the open position of the lever 27.

In assembling my improved pen, the link 17 is first attached to the bar 18, then to the end of the spring 20. These three parts are 15 then pushed into the interior of the casing 10 and when the projection 23 reaches the hole 24 it will snap therein, thereby holding the shell and its associated parts firmly in the interior of the casing 10. The casing 10 20 is provided with a slot 40, and the pivot bar 26 is so situated with reference to the projection 23 that when the projection 23 is located by the hole 24, the pivot hole 26 will lie across the slot 40. The lever 27 is then 25 inserted by placing the pivot hole 28 over the pivot bar 26, the slot 38 permitting such action. After this has been done, the plug 11 which serves as a support for the nib 12 and the sack 14 is then inserted in the casing 30 10 and the pen is ready for use.

It will be observed that when the lever 27 is in its closed position, as shown in Fig. 1, the under part 41 of the lever 27 will lie in the slots 34 and 35 of the presser bar 16, 35 and also when the lever is in its open position, as shown in Fig. 2, that said slots will be engaged by the ears 32 and 33. The presser bar is thus at all times maintained

in its proper position.
It will be observed that the operating parts of my herein described pen are all made from pieces which can be made by punchpress operations, and as a result of this cheapness and accuracy are obtained.

My herein described construction has the great advantage that all of the operating parts, that is, the lever 27, the link 17 and the presser bar 16 may be assembled on the shell 22 and adjusted to their correct position 50 prior to inserting these parts in the casing 10. I also wish to point out that the only connection of these parts with the casing 10 is through the medium of the locating lug 23, which locates the parts by means of the 55 hole 24. It is therefore possible to maintain the dimensions of these operating parts with great exactness, something which would not be possible if certain parts, for instance, the pivot bar 26, were wholly or in part sup-60 ported by the rubber casing 10. After the pivot and presser bar action has been tested as just described, the lever 27 may be taken off of the shell 22 and said shell inserted into the casing 10 as hereinbefore described.

Many changes and alterations may be

made in the precise structure herein described without departing from the spirit of

my invention, since I claim:

1. In a fountain pen, the combination of a casing, a deflatable sack inserted in said 70 casing, an operating lever for said sack, a pivot for said operating lever, and a shell having said pivot integral therewith adapted to be inserted in said casing and extending longitudinally thereof a distance greater 75

than the diameter of said pivot.

2. In a fountain pen, the combination of a casing, a deflatable sack inserted in said casing, an operating lever for said sack, a pivot for said operating lever, said operating lever being removably mounted on said pivot, and a shell having said pivot integral therewith adapted to be inserted in said casing and extending longitudinally thereof a distance greater than the diameter of said 85

3. In a fountain pen, the combination of a casing, a shell adapted to be inserted in said casing, a pivot integral with said shell, and an operating lever formed of a single 90 piece folded longitudinally and having slotted pivot holes therein mounted on said

4. In a fountain pen; the combination of an outside casing; a deflatable sack; a presser 95 bar; a shell adapted to be sprung in said casing having one of its extremities so bent as to form a laterally extending spring; and a link pivotally mounted on said spring, the opposite end of said link being pivot- 100 ally connected with the pressure bar.

5. In a fountain pen, the combination of an outside casing, a deflatable sack, a presser bar, a shell adapted to be sprung in said casing and having a spring at one end, a 105 link mounted on said spring, a presser bar attached to said link, and a lever for actuating said presser bar pivoted on said shell.

6. In a fountain pen, the combination of an outside casing, a deflatable sack, a presser 110 bar, a shell adapted to be sprung in said casing and having a spring at one end, a link mounted on said spring, a presser bar attached to said link, and a lever for operating said presser bar removably pivoted on 115 said shell.

7. In a fountain pen, the combination of a casing, a casing locating means to locate said shell in its proper position relative to said casing, a spring attached to said shell, 120 a link attached to said spring, a presser bar for the deflatable sack attached to said link, a pivot integral with said shell, and an operating lever for said presser bar mounted

on said pivot. 8. In a fountain pen, the combination of a casing, a deflatable sack therein, a presser bar adapted to deflate said sack, said presser bar being provided with an upwardly extending lug, a locating notch, and a lever 130

125

adapted to act on said lug and having an ear to enter said locating notch, thereby maintaining said presser bar in its proper

9. In a fountain pen, the combination with a presser bar, of a lever formed of a single piece of flat stock folded longitudinally, said lever having a portion adapted to be pivoted relative to said casing, a second portion defining the open position of said lever, a third portion adapted to contact with said presser bar and thereby operate the same, and a fourth portion adapted to engage said presser bar and hold said presser bar from shifting while said presser bar is operated by the third portion of said

lever.

10. In a fountain pen, the combination of a casing, a shell adapted to be sprung in said casing, said shell having its rear portion extending into a spring and being provided with a pivot portion integral with said shell, a presser bar, a lug on said presser bar, a link connecting said presser bar and said spring, a lever mounted on said pivot, said lever being so mounted in relation to said lug and spring that the lever will be held in its closed position by the action of said spring when said lever and said lug are in engagement.

In witness whereof I have hereunto sub-

scribed my name.

JOHN C. WAHL.
